GenAI Declaration
Exercise 6

Student

Nguyen Ngoc Lam Dan | Student ID: 104992198

Assessment

COS30045 Data Visualisation - Demonstration 2, Exercise 6

Date

26 October 2026

Tool and purpose

I used OpenAI Codex (GPT-6-based coding agent) to help implement the Week 4-6 exercise plan, prepare a local D3 v7 demonstration website, troubleshoot code and draft supporting documents.

Scope of AI assistance

Codex generated the CSV loader, histogram, scatterplot, screen-technology filters, record-count summary, tooltip and accessible record selector. It added the extension in which one filter updates both charts while keeping bins and domains fixed. It generated automated checks for missing numeric values, frequency totals, bin boundaries, domain endpoints, empty input and retention of the outlier, and performed browser interaction and layout checks.

Review and verification

Codex inspected the course instructions and supplied files, generated code and workflow settings, and ran the checks recorded in evidence/TEST-RESULTS.md. Its changes include explicit numeric parsing, source caveats, labels and accessibility support. Only checks actually performed are recorded. No participant feedback, Developer Tools capture or KNIME execution evidence was invented.

Responsibility and limits

The SVG, website code, tests, workflow adaptations and this declaration include substantial AI assistance. I must review the submitted work and be able to explain and modify it during the oral demonstration. The AI-generated material is not a claim that I independently wrote every line, completed every manual step or demonstrated personal understanding. Any outstanding checks are identified in the README and submission checklist.
