GenAI Declaration
Exercise 4

Student

Nguyen Ngoc Lam Dan | Student ID: 104992198

Assessment

COS30045 Data Visualisation - Demonstration 2, Exercise 4

Date

1 November 2026 (revised after the classroom demonstration)

Tool and purpose

I used OpenAI Codex (GPT-6-based coding agent) to help implement the Week 4-6 exercise plan, prepare a local D3 v7 demonstration website, troubleshoot code and draft supporting documents.

Scope of AI assistance

Codex generated the initial and revised SVG house, coordinate explanations, grouped windows, the preserved D3 selection/append example, CSV-loading code, horizontal bar chart, responsive styling and navigation. It adapted the supplied brand workflow by adding a CSV Writer. The original supplied brand-count CSV was preserved and independently checked against the teaching snapshot.

After the demonstration

Following the classroom demonstration, Codex refined the website layout, typography, chart presentation, source notes and responsive behaviour, prepared a coordinate diagram and browser evidence, updated documents, and configured Vercel hosting at my request. The original datasets and analytical definitions were retained.

Review and verification

Codex inspected the course instructions and supplied files, generated code and workflow settings, and ran the checks recorded in evidence/TEST-RESULTS.md. Its changes include explicit numeric parsing, source caveats, labels and accessibility support. Only checks actually performed are recorded. No participant feedback, Developer Tools capture or KNIME execution evidence was invented.

Responsibility and limits

The SVG, website code, tests, workflow adaptations and this declaration include substantial AI assistance. I completed the classroom demonstration, as reported in this session. This declaration does not claim that I independently wrote every line or that an automated check assessed my understanding. Outstanding manual checks are identified in the submission checklist.
